I wonder when Aurora Energy's wastewater discharge permit is up for renewal. Although recreational pursuits are low on the priority list, when combined with the effect on migratory waterfowl, public safety, etc., it might be enough.

Next question - where does Aurora Energy put it's wastewater if not in the river and are we willing to pay for it in our bills?

Anywhere but pikes...I would love to see T.J. miss out on all the revenue that this race brings to pikes...Kinda Sweet Justice for him voting on the stimulus that will eventually take hard earned money out of our childrens pockets..You reap what you sow...jay,I believe you can even find that passage in the Tora..If you were to spend a little more time studing that(since you are so devout)instead of how to fill your pockets with our kids money you would know this..I say w/the all the criminal behavior going on there lately & now this.. The state should step in & confiscate the bldg., sell it at auction to help offset the DEBT owed by us taxpayers, That T.J. VOTED us into....

"VOTE NO for TRAITOR JAY in 2010"

Make them do about 20 laps around Nenana and the finish line could be where we used to have the halfway party(for the pikes to nenana race) out on the Tanana...Oh those were the days...

Once again, we see the folly of allowing FMUS and now Aurora Energy to use the Chena River as dump for its process water. Miles below the coal-fired power plant, no ice can form. EPA gives the plant a pass on heat pollution. And yet, open water in the winter is dangerous, an amenity lost and an economic harm. The community is denied full use of the river. Plans were in place to pipe the warm water to the fish hatchery, but deleted at the last minute. Such resource management is an affront to our European neighbors. They would be growing produce or raising fish with this warm water. They would enjoy the

full use of a safe travel corridor. Among those who acknowledge these deficits, leadership is lacking.

You are telling me these people really think it is going to get cold enough to make ice thick enough to hold a snowmobile in three days.
